## Design Model

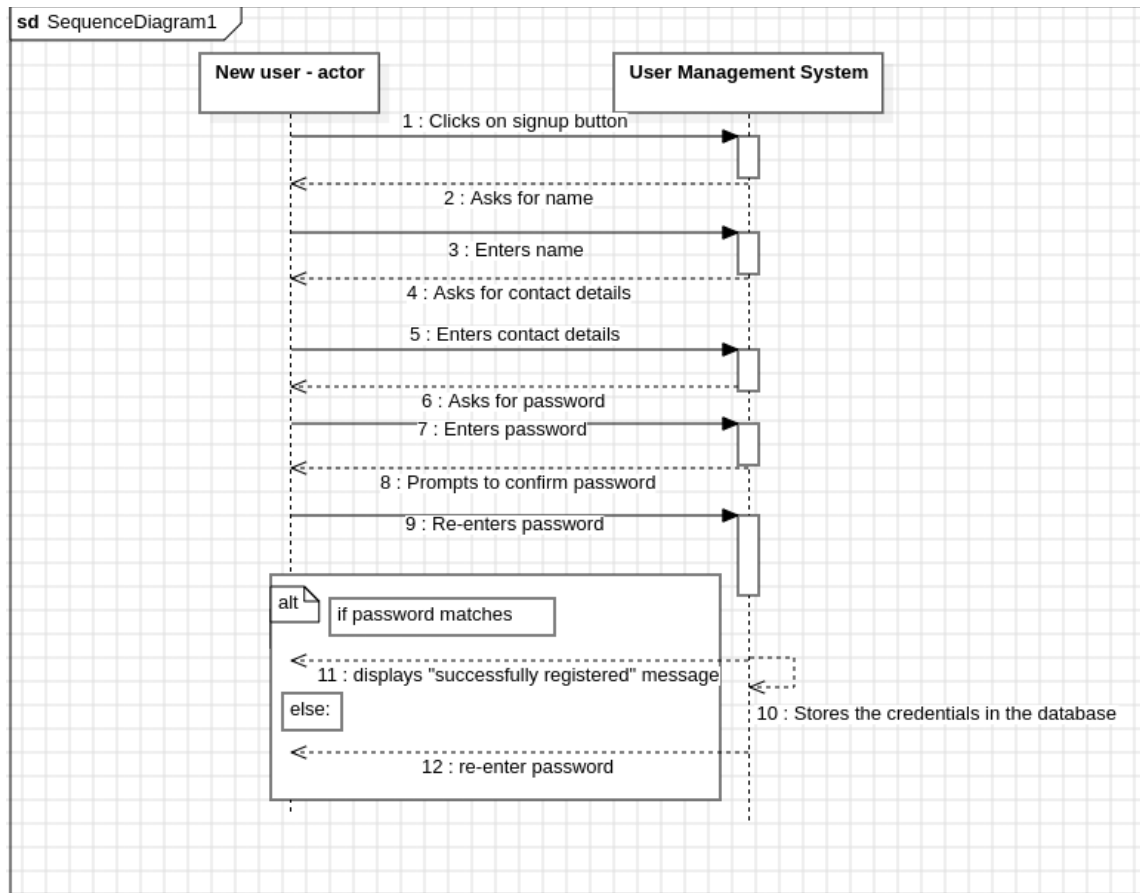

<b>User</b>	<p>Class state</p> <ul style="list-style-type: none"> <li>Holds the current status of all the users such as their name, contact, role in their organization, etc.</li> </ul> <p>Class behavior</p> <ul style="list-style-type: none"> <li>Methods to retrieve password and role of the user, and to change password of the user.</li> </ul>
<b>Startup</b>	<p>Class state</p> <ul style="list-style-type: none"> <li>Holds the current status of name, location and sector of the startup</li> </ul>
<b>Investor</b>	<p>Class state</p> <ul style="list-style-type: none"> <li>Holds the current status of name, location, mail domain and number of funds of the investor firm.</li> </ul> <p>Class behavior</p> <ul style="list-style-type: none"> <li>Retrieve number of funds of the investment firm.</li> </ul>

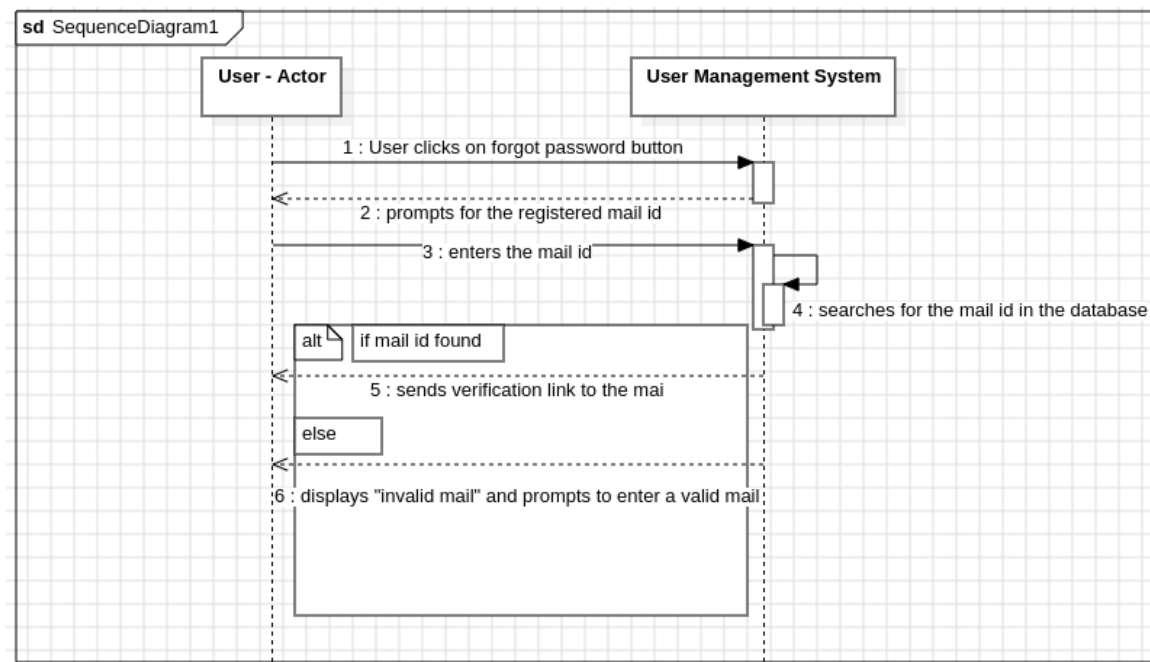

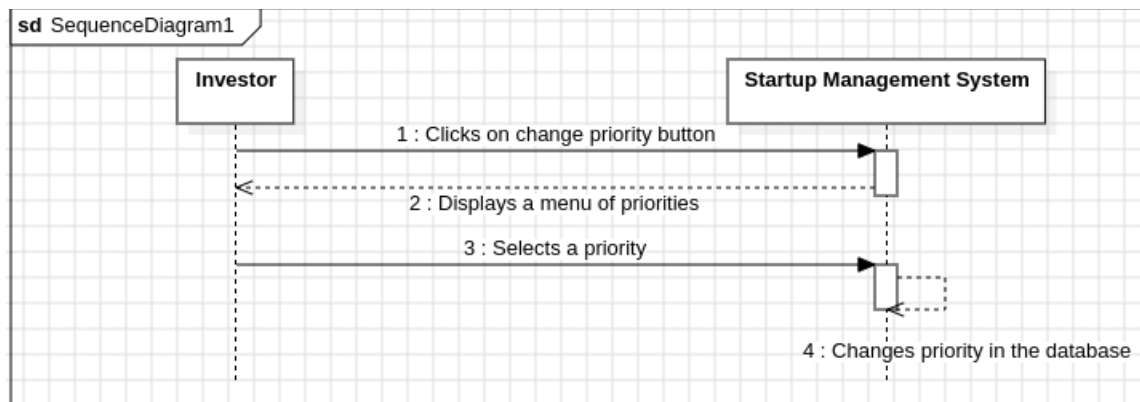

<b>Angel Investor,</b> <b>Venture Capitalist,</b> <b>Private Equity Firm,</b> <b>Bank</b>	<p>Class state</p> <ul style="list-style-type: none"> <li>Holds the current status of name, location, mail domain and number of funds of the investor firm. These are the generalizations of the investor class.</li> </ul> <p>Class behavior</p> <ul style="list-style-type: none"> <li>Retrieve number of funds of the investment firm – same as investor class.</li> </ul>
<b>Startup Management System</b>	<p>Class state</p> <ul style="list-style-type: none"> <li>Holds the current status of deal sector, priority, actions related to sourcing for the investor.</li> </ul> <p>Class behavior</p> <ul style="list-style-type: none"> <li>Change priority of the deal.</li> </ul>
<b>Investment</b>	<p>Class state</p>

<b>Management System</b>	<ul style="list-style-type: none"> <li>Holds the current status of number of startups, timeline, focus sectors of startups under the investor's investments.</li> </ul> Class behavior <ul style="list-style-type: none"> <li>Create and delete instances of investments.</li> </ul>
<b>File System</b>	Class state <ul style="list-style-type: none"> <li>Holds the name, permissions of files.</li> </ul> Class behavior <ul style="list-style-type: none"> <li>Methods to modify permissions of accessibility of files among different users within the investment firm.</li> </ul>
<b>Metrics System</b>	Class state <ul style="list-style-type: none"> <li>Holds the current status of revenue metrics and profiles of startups in the investor's investments.</li> </ul>

## Sequence Diagram

## Design Rationale

Numerous startups are funded annually by investors such as venture capitalists, angel investors, etc. Without an appropriate, organized software platform to help, managing, monitoring, communicating, and strategizing for all those portfolio startups becomes more and more challenging.

Because of this, the main objective of our project is to develop a strong startup investment portfolio management software for investors, which includes features such as - data management, analytics, market trends, predictive insights, etc

The end-users that are going to be using the system are – Angel Investors, Venture Capitalists, Syndicates and Private Equity Firms.

- Angel Investors : Angels are the first investors to any startup.
- Venture Capitalists/ Syndicates : The investor who typically invests in an early stage of business, when the business is (typically) in a better situation – generating revenues, and

the healthy inflow of revenue validates the business and its offerings.

- Private Equity : Investors who come into picture at a later stage when the company's success continues to grow. Private Equity investors invest at a mature stage and take a lesser risk compared to Venture Capitalists, and typically invest larger amounts.
